Quiz Instructions

Question 1 15 pts

You bring the magnet toward the conductive loop. What happens as the magnet approaches the loop

A current is induced CW

nothing happens.

An alternating current is induced

A current is induced CCW

Question 2 15 pts

As the conductive loop enters the magnetic field (from the right). What happens

- ☐ current is induced and is CCW
- ☐ There is no current flowing
- ☐ alternating current is induced
- ☐ current is induced and is CW
- ☒

Question 3 15 pts

Now the loop is entirely inside the magnetic field (no change in field lines through the loop) .

- ☐ There is no current induced
- ☐ There is an alternating current induced
- ☐ There is a CCW induced current
- ☐ There is a CW induced current
- ☒

Question 4 20 pts

As the loop leaves the magnetic field region (left).

- ☐ the induced current is CW
- ☐ The current induced is alternating
- ☐ the induced current is CCW

☐

The induced current is 0

⋮

Question 5 15 pts

1. In the diagram above, the current I increases with time. What is the direction of the induced current in the resistor?
 - (A) To the right
 - (B) To the left
 - (C) There is no current

We can discuss it in class. Use the right hand rule. Your thumb is the straight wire. So the magnetic field (increasing) produced by the wire is : inside the screen ? outside the screen?

the induced current in the circuit wants to create a magnetic field to fight the increase of the magnetic field from the wire.

☐

Can not be determined

☐

B

☐

A

☐

C

⋮

Question 6 20 pts

The induced current is flowing

- ☐ no induced current
- ☐ toward A
- ☐ can not be determined
- ☐ toward B
